# VENDOR MANAGEMENT SYSTEM

Salesforce-based Customer Issue Management

**Project Presentation**

Objects • Automation • Case Routing • Reporting

# Problem Statement & Proposed Solution

Why the Vendor Management System is needed

## PROBLEM STATEMENT

Customers face issues such as product defects, billing, warranty, and technical problems.

- It is difficult to categorize, assign, and track customer issues efficiently.

- There is no centralized system to monitor and manage
customer issues effectively

## PROPOSED SOLUTION

- Manage customers with Contacts and affected items with Products

- Track issues as Cases and assign an Engineer

- Use Email-to-Case, Web-to-Case and Flows for intake and notifications

- Track the 7-day resolution target and monitor reports/dashboard

# Metadata Components — Fields

Custom Case fields listed in the project document

| Important field | Data type | Purpose |
|---|---|---|
| Status(Standard) | Picklist | Shows the current status of the case. |
| Issue Type(Custom) | Picklist | Identifies the type of customer problem. |
| Priority(Standard) | Picklist | Indicates how urgently the case needs attention. |
| Case origin(Standard) | Picklist | Shows where the case was created, such as Email or Phone. |
| Resolution Status(Custom) | Formula | Tracks whether the case has been resolved within the expected time. |
| Target Resolution Date(Custom) | Formula | Calculates the target resolution date as 7 days after the case is created. |

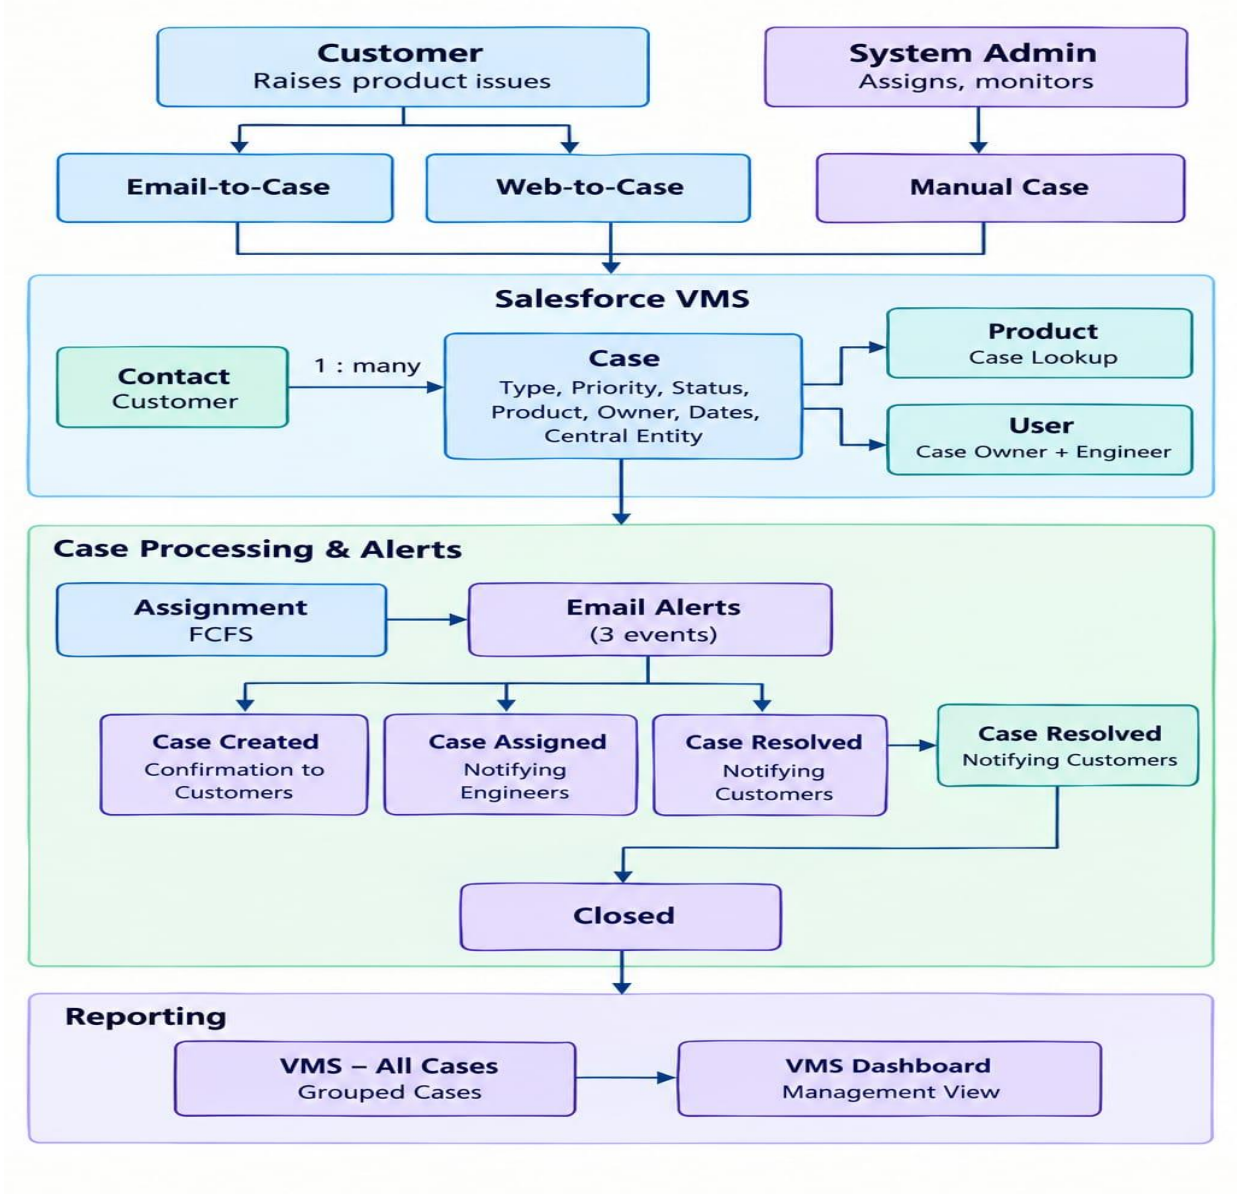

# Metadata & Automation Inventory

Configuration items to verify in Salesforce

| Component | Name | Purpose |
|---|---|---|
| Validation Rule | Restrict_Engineer_Reassignment | Restricts non-System Administrators from changing Case Owner |
| Flow | Auto Associate Existing Contact | Matches Case Web Email to Contact Email |
| Flow | VMS Case Assignment Notification | Assignment email alerts |
| Flow | VMS Case Resolution Notification | Resolution email alert |
| Flow | VMS Case Closure Notification | Closure email alert |
| Reports/Dashboard | VMS Case Management Dashboard | Case visibility by status, priority, issue type and resolution status |

# Metadata Components & Architecture

How customer issues move through the VMS

# Objects Configuration and Relationships

- Main Objects-User, Contact, Product, and Case objects.
- Designed page layouts and related lists for easy record management.
- Implemented engineer assignment controlled by the admin.
- Created validation rule and custom action button.

## Reports:

- Created reports to monitor and analyze customer cases.
- **All Cases Report:** Displays all cases in the system.
- **Cases by Priority:** Shows cases based on priority levels.
- **Cases by Status:** Tracks the current status of cases.
- **Cases by Resolution Status:** Monitors SLA progress and overdue cases.
- **Cases by Issue Type**: Categorizes cases based on the type of issue.
- **Everyday Case Report:** Report including count of opened and closed cases.

## Dashboard:

- Created a dashboard to visually represent customer cases based on priority, status, resolution status, and issue type.
- Outcome: Helps administrators monitor case progress, identify critical issues, and analyze overall case management performance efficiently.

# Case Management and Automation

- Configured Email-to-Case and Web-to-Case to create cases automatically.
- Set up email routing, contact association, and replies to existing cases.
- Created email templates and case auto-response rules.
- Built flows and email alerts for case assignment, resolution, and closure notifications.
- Configured queue and case assignment rules for default queue assignment

# Omni-Channel Routing

- Configured Omni-Channel to manage incoming cases.
- Set up routing to assign cases to available agents.
- Configured agent availability and routing settings.
- Enabled agents to receive and manage cases through Omni-Channel.
- Improved case distribution and reduced manual assignment.

# End-to-End VMS Workflow

From customer issue to management visibility
